                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: AUDONNET, Jean-Christophe
APPLICANT: BOUGHARDON, Annabelle
APPLICANT: BOUGHER, Michel
TILLE OF INVENTION: POLYNCLEOTIDE VACCINE FORMULA AGAINST CANINE
TITLE OF INVENTION: PATHOLOGIES, IN PARTICULAR RESPIRATORY AND DIGESTIVE
TITLE OF INVENTION: PATHOLOGIES
APPLICANT: Smith, Rodger G.
APPLICANT: Darsley, Michael J.
APPLICANT: Simpson, David B.
TITLE OF INVENTION: REACTION-BASED SCREENING FOR EXPRESSION
TITLE OF INVENTION: OF AND CONCENTRATION OF CATALYTIC MOIETIES
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSED: Curtis, Morris & Safford, P.C.
STREET: S30 Fifth Avenue
CITY: New York
STATE: New York

PREARL NO. 6007990
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Levine, Robert A.
APPLICANT: Wardlaw, Stephen C.
TITLE OF INVENTION: Detection and Quantification of One or
TITLE OF INVENTION: More Nucleotide Sequence Target Analytes in a Sample Using
PREARL NO. 6007990
PITLE OF INVENTION: Spatially Localized Target Analyte Replication
FILE REFERENCE: UFB-001
CURRENT APPLICATION NUMBER: US/08/841,267C
CURRENT PILIG DATE: 1997-04-29
NUMBER OF SEQ ID NOS: 24
SEQ ID NO 15
SEQ ID NO 15
LENGTH: 40

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

                                                          The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

of SEREX (Systematic Evolution of Ligands obtained after 17 rounds of SEREX (Systematic Evolution of Ligands by Exponential enrichment). The Sequences were analysed for conserved sequences and aligned by this criterion. The 2'F sequences fell into a single group with 12 orphan sequences. 2'NH2 sequences fell into 2 distinct groups. Group 1 were shown to bind to Lize and were identified by the presence of a direct repeat of the sequence GGAGG. A single orphan 2'NH2 sequence was also found. The 2'F/NH2 sequences fell into 3 groups, of which one group bound to nitrocellulose filters. Nucleic acid (NA) ligands to a cytokine can be identified using SELEX. A candidate mixture of NA's are contacted with a cytokine where the NA's having an increased affinity to the cytokine relative to the candidate mixture may be partitioned from the cytokine relative to the candidate mixture may be partitioned from the cytokine relative to the candidate mixture may be partitioned from the cytokine relative of NA's with increased affinity are amplified to yield a mixture of NA's enriched for the NA sequences and relatively higher affinity and selectivity for binding to the cytokine. The NA is a considered or the cytokine where the NA's enriched for the NA sequences and relatively higher affinity and selectivity for binding to the cytokine. The NA is a considered to the cytokine where the NA is a considered and relatively higher affinity and selectivity for binding to the cytokine. The NA is a considered to the cytokine in the NA is a considered to the cytokine. The NA is a considered to the cytokine to the cytokine. The NA is a considered to the cytokine to the cytokine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to prevent or treat diseases or medical conditions in human patients, e.g. associated with excessive cytokine production such as inflammatory responses mediated by IRN-gamma or interlaukin-4, septic shock, arthritis or graft-vs-host reactions mediated by tumour necrosis

AAT87178-276 are interleukin (IL)-4 RNA ligands obtained after 17 rounds of SELEX (Systematic Evolution of Ligands by Exponential enrichment). The sequences were analysed for conserved sequences and aligned by this criterion. The 2'F sequences fell into a single group with 12 orphan sequences. 2'NH2 sequences fell into 2 distinct groups. Group were shown to bind to introcellulose filters and were identified by the presence of a direct repeat of the sequence GGAGG. A single orphan 2'NH2 sequence was also found. The 2'F/NH2 sequences fell into 3 groups, of which one group found. The 2'F/NH2 sequences fell into 3 groups, of which one group can be identified using SELEX. A candidate mixture of NA's are contacted with a cytokine where the NA's having an increased affinity to the cytokine relative to the candidate mixture may be partitioned from the cytokine relative to the candidate mixture may be partitioned from the rest of the mixture. The NA's with increased affinity are amplified to yield a mixture of NA's enriched for the NA's equences and relatively higher affinity and selectivity for binding to the cytokine. The NA ligands are useful in diagnostic and therapeutic applications especially
                                                                                       ö

When labelled with a fluorophore, the blocking oligonuclectide can also be used to monitor the amplification process by participating in fluorescence energy transfer. This energy transfer can be enhanced by using the blocking oligonuclectide as a template for ligation of its complementary sequence to the primer. In an example, the human acute myeloid leukaemia breakpoint related sequence was asymmetrically amplified using an excess primer and a limiting primer (see AAT09719 and AAY09720, respectively). The

The sequences of the primers used for AML-1 and AMG-X respectively were AMT4549 and AAT45480, the duplex comprised AAT45481 and AAT45482 and the sequences of excess and limiting primers for AML-1 and AMG-X respectively were AAT45483 and AAT454848. The respectively were AAT45483 and AAT45484 and AAT45485 and AAT45486. Male human genomic DNA sequences were asymmetrically amplified with excess primer for compiled from detection at cycle 30 demonstrated the quantitative resolution and detection sensitivity by the duplex. The decrease in fluorescence intensity reflected the initial target doses.

This is a limiting primer used in a kit for detecting a target nucleic acid of human acute myeloid leukaemia breakpoint related sequence (and of human acute myeloid leukaemia breakpoint related sequence (capalle of acting as a primer, with or without a segment noncontiguous to its priming sequence, for use with a polymerase in the amplification of a target nucleic acid, a second oligonucleotide which is hybridised, via the first oligonucleotide, the second oligonucleotide pairings, with the first oligonucleotide, the second oligonucleotide pairings, with the first oligonucleotide, the second oligonucleotide and a second fluorophore covalently attached to the first oligonucleotide, with one of the two fluorophores of being a donor fluorophore and the other being an acceptor fluorophore covalently attached to the second oligonucleotide, with one of the two fluorophores of that when the two fluorophores are in close proximity resonance energy transfer between them is allowed. Each of the first oligonucleotide contains 10-50 nucleotides. Another kit claimed comprises a first and second primer both optionally having a tespectively, which are used with a polymerase for the amplification of the target nucleic acid and an oligonucleotide which is incapable of acting as a primer for the polymerase for the amplification of the first primer. Each of the first oligonucleotide contains 10-50 nucleotide being incapable of acting as a primer for the polymerase on that is incapable of acting as a primer for the polymerase and has at least 5 consecutive nucleotides contains 10-50 nucleotide being incapable of target nucleic acid comprises a first oligonucleotide being incapable of acting as a primer for the polymerase and has at least 5 consecutive nucleotides of the first oligonucleotide soft and containing 10-50 nucleotides with a second plinaer and the first oligonucleotide soft acting as a primer for use with a polymerase of the manual and polymerase of hybridizing, via at least 5 consecutive fluorophore covalently attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleotides, and the first and second fluorophores, one of which is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proximity when the first oligonucleotide hybridises to the second oligonucleotide to allow resonance energy transfer between them. The kits are used in homogeneous assays in which the target nucleic acid sequence is amplified and the amplified target is detected without

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 known genetic mutations, using modified nucleoside triphosphates to improve the performance. The method compiless: (1) amplifying a DNA sequence by polymerase chain reaction (PCR) using primers selected to amplify a sequence containing the mutation; (2) adding a particular set of modified nucleoside triphosphates (NTPS) to effect innited extension of already present or newly added primers, where: (a) the extension reaction stops at the next occurrence of a particular base in the DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 strand being copied; (b) the extension reaction proceeds up to or past the mutation site, so that wild-type amplification products will have a different molecular weight from mutant amplification products; and (c) the modification of the NTPs results in stabilization of the DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a method for mass-spectrometric analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer; mass-spectrometry; genetic mutation; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a new regulatory sequence for Trichoderma Villed detaived cellulase cbhl gene and the establishment of a system for mass producing cellulase in moulds such as T. viride. As the regulatory sequence of cbhl genes originating in T. viride can highly express objective proteins, proteins such as cellulase can be expressed. An expression vector containing the regulatory sequence and Hunicola insolens derived endo-glucanase NCE4 DNA was produced, and used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Coupled polymerase chain reaction; PCR; ligase detection reaction; LDR; restriction endonuclease digestion; RED; infectious disease; cancer; waste water purification; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotides AAV36074-75 are used in the course of the invention.

The specification describes the use of coupled polymerase chain reaction (PCR), restriction endonuclease digestion (RED) and ligase detection reaction (LDR) to identify one or more low abundance sequences differing by one or more single base changes, inserts or deletions, from a high abundance sequence, in several target nucleotide sequences. The method involves 3 PCR reaction phases, a RED phase and an LDR phase. The method is used to identify one or more low abundance sequences. The method is also useful for detecting a wide variety of infectious diseases caused by acterial, viral, viral, parasite and fungal infectious agent. Cancers can also be detected by this method. The method is also used for detection, identification and monitoring of pathogenic and indigenous municipal waste water purification system and water reservoirs or in polluted areas undergoing bioremediation and to detect plasmids containing genes that can metabolise xenoblotics, to monitor specific target microorganisms in population dynamic studies, or either to detect, identify, or monitor specific target microorganisms in the environment and in industrial plants. The present sequence represents a synthetic duplex DNA template, used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; c-fos; hammerhead ribozyme; hairpin ribozyme; target site;

                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                      The present invention describes an enzymatic nucleic acid molecule which specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540 and AAV95541 to AAV95584 represent hammerhead ribozymes and hairpin
                                                                                                                                                                                                                  ribozymes, respectively, which specifically cleave human c-fos. AAV95261 to AAV95400 and AAV95385 to AAV95628 represent human c-fos target sequences. The enzymatic nucleic acid molecules can be used for treating cancer associated with elevated levels of c-fos oncogene, especially leukaemias, neuroblastomas and lung, breast and colon cancers. The ribozymes may also be used as diagnostic tools to examine genetic drift and mutations within diseased cells, or to detect the presence of c-fos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves

```
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention is used in producing a recombinant organism that can be used to express SLG6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLG6A4 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it
RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1 ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Polymorphica comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular ILARalpha protein isoform, an expression desirable to decrease or block expression of a particular ILARalpha protein isoform, an expression of asiane to decrease or block expression of a particular ILARalpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human ILAR-alpha.

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer

Acyl-CoA:cholesterol acyltransferase; ACAT; ACAT-like protein; sterol; ester; triacylglycerol; fatty acyl-CoA; lipid composition; plant cell; diacylglycerol acyltransferase; DAGAT; triglyceride; cancer; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a translational reporter vector selected from p2luc and p2luci. The vectors have a polylinker interposed between a renilla luciferase gene and a firefly luciferase gene, which are out-of-frame with respect to each other but are co-expressed upon recoding. The translational reporter vector is useful for assaying translational recoding in vitro or in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Translational reporter vector for quantification of translation recoding in vivo and in vitro, comprises renilla luciferase gene, polylinker for insertion of selected DNA and an out-of-frame firefly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         per primers AA245392-93 were used to amplify rat acyl-CoA:cholesterol acyltransferase (ACAT)-like gene. The ACAT-like protein is active in the formation of a sterol, ester and/or triacylylycerol from a fatty acyl-CoA and sterol and/or diacylglycerol substrate. The DNA can be used for modifying the lipid composition of plant cells. The ACAT-like protein has diacylglycerol acyltransferase (DAGAT) activity, and so the synthesis of triglycerides can be suppressed or increased using the DNA. The protein can be used to produce plant oils with a modified triglyceride content. The products can also be used to identify antagonists and agonists of badAT activity. Such agonists and antagonists are particularly useful in treating or ameliorating diseases associated with DACAT activity, including concentration or PKC activity, including cancer, diabetes, concentration or PKC activity, including cancer, diabetes, cardiopulmonary diseases e.g. heart failure, atherosclerosis, adisorders, obesity, diseases associated with abnormal lipid metabolism, and diseases associated with abnormal fat absorption,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotides used for modifying plant oil composition and for developing products for treating e.g. cancer, diabetes, cardiopulmonary disease or metabolic disorders
cardiopulmonary disease; heart failure; atherosclerosis; adipocytosis; leukaemia; skin carcinoma; fibroblastoma; metabolic disorder; obesity; abnormal lipid metabolism; abnormal fat absorption; lipoprotein secretion; adipogenesis; PCR primer; ss.

```
The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease. The polymorphisms can be tested for association with other disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipilus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholestenolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Enhars-Danlos syndrome, osteogenesis imperfecta, and content intentitent porphyria. The polymorphic forms can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Van Eenennaam A;

```
The invention relates to nucleic acids encoding novel plant
acyltransferase-like proteins (AAA37343-A37445) which comprise one of
acyltransferase motifs (AAA9344-Y99481). Acyltransferases
conserved acyltransferase motifs (AAY9944-Y99481). Acyltransferases
catalyse the transfer of acyl groups from an open avriety of
substrates such as glycerides, sterols, stanols and phosphatides.
Characteristics of the plant. For example, cold-hardened plants have
different lipid concentrations in the cell membrane compared to
non-hardened plants, which makes the membrane more fluid and the plant
mon-hardened plants, which makes the membrane sequences of the
invention can be used as probes or for expressing acyltransferase-like
proteins in host cells e.g., for recombinant protein production. They
may be expressed in plant cells to alter the lipid composition of the
primers used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cDNAs (AAA37331-A37342) for cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prenyltransferase; ATPT1; ATPT2; ATPT4; ATPT4; ATPT5; ATPT6; ATPT7; ATPF8 ATPT9; ATPT8 ATPT1; ATPT12; tocopherol; homogentisic acid; phytylpyrophosphate; 2-methyl-6phytylbenzoquinol; antioxidant; nutritional supplement; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primers AAV42720-21 were used to amplify human furin cDNA (see AAV42731). The amplified product is used in the retroviral vector of the invention to encode a cell bound prodrug convertase for ablation therapy. The specification describes a gene delivery vehicle which directs expression of a non-immunogenic selectable marker or molecule which is capable of activating a previously inactive compound. Vectors expressing the markers and a heterologous sequence are useful in gene therapy. The vectors can be used to deliver a molecule into a target area where it may cause the activation of a previously inactive substance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Arabidopsis thaliana acyltransferase ATAT7 PCR primer, SEQ ID NO:173.

The invention relates to raising a neutralising antibody response to a broad spectrum of HIV (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or mimics highly conserved portions of the gp41 envelope glycoprotein which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or mimic the coiled coil solution structure of the N-helical domain (the heptad repeat region), or can correspond or mimic the C-helical domain (the transmembrane-proximal amphipathic alpha-helical segment), or the gp41 core 6-helical domains of three gp41 proteins. The peptides can be administered either singly or as a combination of N-helical and C-helical peptides), and can be administered either singly or as a combination of N-helical and C-helical domain peptides can be altimized. For example, N- and C-helical domain peptides can be altimized together to form a peptide which mimics the core alternately linked together to form a peptide (s) generates a humoral response, with the production of antibodies against gp41 structures involved in viral entry. As these portions of gp41 are well conserved,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV-1; gp41; N-helical domain; heptad repeat region; C-helical domain; gp41 transmembrane-proximal amphipathic alpha-helical segment; core 6-helix buddle; viral entry inhibition; immunogenic; antibody; humoral response, broad spectrum vaccine; anti-HIV; envelope glycoprotein; prophylaxis; therapy; PCR primer; ss.

such antibodies may be effective against a broad range of HIV strains and isolates. The peptide compositions may be administered as a prophylactic or therapeutic vaccine to generate antibodies which reduce or inhibit the ability of HIV to infect uninfected cells. A composition comprising polyclonal or monoclonal antibodies can be administered to entry-relevant gp41 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry. Sequences AAA72104-A72107 represent PCR primers used in an exemplification of the invention to construct DNA (AAA72102) encoding a protein construct (AAB14603) comprising the N- and C-helical domains of HIV-1 gp41 separated by a short peptide linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a PCR primer for the mouse ribonucleotide reductase R1 (RRR1) gene. The gene and the protein it encodes can be used in the methods of the invention for modulating tumourigenicity of neoplastic cells in a mammal. The RRR1 can slow tumour growth and cause tumour regression and reduction of tumourigenicity and metastatic
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of ribonucleotide reductase R - for modulating the tumourigenicity and metastatic potential of neoplastic cells in a mammal, particularly for inhibiting tumour growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5-8 of the human methylthicadenosine phosphorylase (MTAP) gene on antisense primer (see AAZ35351). The primer is used, with an antisense primer (see AAZ35351). The primer is used, with an antisense primer (see AAZ35355), in a PCR amplification (505 bp product) in step (a) of claimed methods for diagnosis of, and determining a prognosis for, cancer causatively associated with determining a prognosine 5p21. Step (a) of these methods involves determining whether any portion of the 9p21 chromosome including and telomeric to STS 3.21 is deleted, or whether any portion of 9p21 centromeric to STS 3.21 is deleted. Step (b) involves determining whether any portion of 9p21 centromeric to STS 3.21 is deleted. The results are indicative of a cancer at an early stage or advanced stage of tumour development. Primer pairs (see a AZ3554-75) are provided for use in the claimed methods, where the cancer is a glioma, primary lymphoid malignancy, non-small cell had an early cancer or a chondrosa round conservance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for cancer causitively associated

     The invention relates to a mammalian PG1 gene and protein, and a set of used biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited auffections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative procedure which would enable early-stage diagnosis, and for preventative detection of prostate cancer, and the risk of developing it in the
                                                                                                                                                                                                                                         PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of a prostate cancer associated gene and biallelic markers

Sequences AAA38349-A38388 represent antisense oligonucleotides targetted to the human Ets-2 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human class. RNA, and were analysed for their effect on Ets-2 mRNA levels by quantitative real-time PCR. The Ets-domain transcription factors are a family of proteins which are involved in controlling key cellular events such as proliferation, differentiation and development. The Ets domain is a DNA-binding domain shared by all members of this family. Through this motif, Ets family members bind to the promoter regions of various genes at a GCA consensus sequence, thereby acting as either repressors or activators of the gene. All but one Ets family protein bind to DNA as monomer. Ets-2 has been implicated in the regulation of cellular proliferation and differentiation. The Ets-2 gene is located at chromosome 21q22.3, which is within a region known to undergo translocations associated with malignancies. Ets-2 has been found to be upregulated in several cancers, including lymphoblastic leukaemia. It may also play a role in the cancer phenotype, as it activates the urokinase plasminogen activator to epidermal growth factor (EGE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             stimulation. High levels of upA and metalloproteinases are associated with tumour invasion and metastasis in breast cancers. As the Ets-2 gene is located on chromosome 21, which is triplicated in Down's syndrome, it is also thought to be responsible for the skeletal abnormalities present in this condition. The antisense oligonucleotides of the invention are useful for the treatment or prophylaxis of conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

AAA29335-38 are oligonuclectide primers used to synthesize the alpha and beta chain cDNA for a MAGE-1 specific T cell receptor from the CD8 positive cytotoxic T lymphocyte (CTL) clone 82/30. Novel immune cells with predefined specificity, are produced by either complexing the cells with an antigen specific MHC-restricted TCR or transfecting the cells on thigher specific MHC-restricted chimaric TCR gene. The antigen-specific MHC-restricted chimaric TCR gene. The antigen-specific MHC-restricted for complexed with lymphocytic cells for treatment of a tumour. Alternatively, the autologous climents of a transfected with an antigen specific MHC-restricted for in antigen associated with the tumour and a segment encoding a single chain TCR (scFv-TCR) which binds to an antigen associated with the tumour and a segment encoding a signal transducing element of an immune cell. Compositions comprising the manner cells may be used for the treatment of cancer (especially melanomas, if the TCR binds to the MAGE-1 antigen), infectious diseases, autoimmune disease and/or graft rejection.
                                                                                                                                    human leukocyte antigen; HLA-A1; melanoma; neoplastic; MAGE-1; TCR; MHC; soluble; major histocompatability complex; antigen; T cell receptor; lymphocyte; tumour; cytostatic; anti-microbial; immunosuppressive; primer; alpha chain; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immune cells with predefined specificities useful for treating melanoma
                                                                                               Primer V-beta-3 for MAGE-1 specific TCR-alpha chain cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 29 BP; 4 A; 10 C; 11 G; 4 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a PCR primer for DNA encoding a cellulose synthase of the invention. The DNA can be used for controlling cellulose synthesis in a cell by introducing the DNA into the cell, expressing RNA with a nucleotide sequence homologous to the DNA or a nucleotide sequence complementary to the DNA. The cells are prokaryotic cells i.e. acetobacterium and/or eukaryotic cells such as yeasts
                   The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                Gaps

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This primer corresponds to the sequence of plasmid pSPORTI/N89-5, and is the reverse complement of nucleotides 968-948 in a gene encoding mouse bone morphogenetic protein (BMP) receptor type-II kinase-3 (BRK-3), which induces cellular differentiation in response to BMP. The primer may be used with anchor primer AAT27331 in 5'-rapid amplification of CDNA ends (5'-RACE), to isolate 600 bp at the 5'-end of the BKR-3 gene, by PCR amplification of NIB373 mouse embryo fibroblast (ATCC CRL 1658) cDNA. To reduce background, a 2nd round of PCR is performed using nested primer AAT27232 with the anchor primer. This results in isolation of 600 bp from the 5'-end of the gene, which may be used to assemble a full-length clone (AAT27225) by PCR using primers AAT2723-4 and cloning in phage Bluescript-II-SK(-) in Escherichia coll DH5-alpha. The receptor and antibodies against the may be used in diagnostic assays for BMP disorders, or in the beautiful coll by the anchor the may be used in diagnostic assays for BMP disorders, or in the beautiful coll by the BMS and antibodies against the may be used to assays for BMP disorders, or in the beautiful coll by the BMS and antibodies against the may be used to assays for BMP disorders, or in the beautiful coll by the BMS and antibodies against the may be used to assays for BMP disorders, or in the base and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A PCR primer (AAT28037) Includes the reverse complement of a partial cDNA clone isolated from NIBT3 mouse embryonic fibroblasts. It was used with an anchor primer (AAT28038) to amplify the 5' end of mouse bone morphogenetic protein (BMP) type receptor kinase protein-3 (BRK-3) cDNA. Following further PCR amplification and cloning into pUT6, a cDNA clone (AAT28020) coding for full-length murine BRK-3 (AAR55224) was obtd. The PCR primer is the reverse complement of nucleotides 968-948 of this clone.
                                                                                                                                                                                                                                                                                                                                 Assays for bone morphogenetic protein activities - using complex of BMP type I receptor kinase protein and BMP receptor kinase protein BRK-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense primer for mouse BRK-3 gene 5'-end amplification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó;
                                                                                                  frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be contributing factor in heart disease, sarcoidosis, sinusitis, purulent otits media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3684-AAX36879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

                     In an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
present invention provides a method of diagnosing a vascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a PCR primer for the rat retinoblastoma (RD) interacting zinc finger (RIZ) protein (AMB12028). RIZ is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to RD protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the GI phase of the cell cycle, by interacting with RD through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SS.

nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may be used in gene therapy for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in neurodegenerative disorder therapy e.g. for Parkinson's, useful in neurodegenerative disorder therapy e.g. for Parkinson's, disorders, or cardiac disorders e.g. heart disease, where the ability to induce neural, cardiac disorders proliferation would be useful. The present sequence was used in the construction of vectors which were used to clone
                                                                                                                                                                                                                                                                                     mammalian RIZ coding sequences.

New immunogenic recombinant hybrid M protein comprising amino-terminal peptide fragments of streptococcal M protein useful as vaccine against rheumatic fever and infections leading to rheumatic fever Disclosure; Column 13-14; 62pp; English.

The invention relates to multivalent immunogenic hybrid group A streptococcal M proteins comprising N-terminal peptide fragments of M proteins that elicit opsonic antibodies against multiple serotypes of group A streptococci (e.g., Streptococcus pyogenes). The antibodies generated using the hybrid proteins are against one or more M protein serotypes, where at least one of the serotypes is Mi, M3, M18 or M19. The invention also encompasses a recombinant DNA molecule comprising a nucleotide sequence that encodes a multivalent hybrid M protein; and a method for immunisteng a mammal against streptococcal infections, comprising administering an immunogenic multivalent hybrid M protein to the mammal. The multivalent hybrid M proteins are useful for eliciting opsonic or protective antibodies to the M proteins of different

serotypes of group A streptococci, and may therefore be used as vaccines to protect against and control infection by type A streptococci Type A streptococci are not only responsible for streptococcal pharyngitis (strep throat), forms of pneumonia and a condition resembling toxic shock, but are also involved in the development of acute rheumatic fever (ARF) and rheumatic heart disease. In a patient with ARF, antibodies formed during a group A streptococcal infection are also cross-reactive with heart tissue, which indicates that the streptococci and host tissue contain similar antigenic motifs. The new multivalent vaccines are capable of raising sero-specific antibodies against various serotypes of group A streptococci which are not cross-reactive with human heart tissue. Sequences AAA57903-A57904 and AAA57903-A57904 represent PCR primers used in the generation of DNA (AAA57803-A57902) encoding multivalent hybrid Streptococcus pyogenes M proteins (AAB03113-B03117, multivalent.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of surveying the CC (beta) chemokine receptor (CCR) genotypes in a population. The method is particularly applied to the human CCRS and CCR2 genes located on chromosome 3p21-22, which encode co-receptors for HIV-1. The method involves obtaining genomic DNA samples from a representative number of individuals within a population; combining each sample with experimental and control primer combinations to produce primer-annealed DNA; amplifying the DNA to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Surveying CC beta chemokine receptor (CCR) genotypes in population, involves amplifying genomic DNA of individuals with experimental and control primer combinations, size-separating amplicons and determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CCR5/CCR2b PCR primer, SEQ ID:18, used to genotype HIV susceptibility.

Individuals homozygous for the

to the wild-type allele.

```
produce amplicons; separating the amplicons by size; determining the genotype based upon the presence of CCR alleles; and compiling the genotypes determined. The method is particularly applied to the human CCRS and CCRS are associated with a variation in the susceptibility of an individual to infection by HIV-1, or with a variation in the disease c progression of AIDS after infection. The invention specifically claims the experimental PCR primers AAF76119, and the control PCR primers AAF76119-AAF76119, and the control PCR primers AAF76119-AAF76119, and of the invention fulfils a longstanding need for the development of a rapid and informative genotyping strategy that can readily applied to analyse CCRS, CCR2 and related genetic variants, and disease progression. The present sequence represents a human and disease progression. The present sequence represents a human and disease progression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 19 BP; 6 A; 4 C; 5 G; 4 T; 0 other;

This is the nucleotide sequence of a claimed DNA primer, designated delta-32 inv, which can be used for the amplification of HIV-1 CCRS co-receptor nucleic acids. It corresponds to nucleotide 955 of wild-type CCRS cDNA (see AAV84126). 4 Pairs of primers (see AAV84127-34) are provided. These can be used in claimed methods for detecting and identifying the presence of a CCRS variant in a sample. Primer pair delta-31 inv and delta-32 sens (see AAV84127) are particularly useful in detecting the presence of variant CCRS-delta32 (see AAV84159) that contains a 32 bp deletion when New CCR5 variant protein of the HIV-1 co-receptor - useful in developing resistance of CCR5-expressing cells to HIV-1 infection Claim 7; Page 8; 55pp; English.

This sequence is a PCR primer for DNA encoding an epitope-tagged TATA-box binding protein (TBP) that is expressed by the transgenic non-human binding protein (TBP) that is expressed by the transgenic non-human can mimals are used to produce TBP. TBP is used to isolate and characterise higher-order transcription complexes (from different tissue and cell types, optionally at different developmental stages). It is also used to identify new and/or specific. TBP associated factors (TAFS, e.g. transcription factors, activators or inhibitors) and TAF-interaction factors, and to raise antibodies against TBP. The TAFS may be useful for regulating gene expression.

Ce.g. disease-related genes, so are potential pharmaceuticals, also for identifying human analogues for use in drug screening. The antibodies are used for affinity purification of TBP and its complexes. TBP can isolate transcription complexes from a wide variety of different tissues and calls (contrast known methods that are limited to isolation from a

It was used with an upstream primer (see AAX07297) in the RT-PCR amplification of lymphocyte RNA. Bob mRNA was detected in PHA stimulated peripheral blood monounclear cells (PMBC), purified T cells, and weakly in monounclear genes (see AAX0728994) encoding 2 receptors, termed Bonzo macaque genes (see AAX0728994) encoding 2 receptors, termed Bonzo and Bob (see AAW97783-88), that are associated with retroviral entry into cells have been identified. Diagnostic and therapeutic uses of these novel translocation promoting agents are provided, and unitial agents for treatment

The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA6619 to AAA6692. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New radiation hybrid map of the dog, Canine familiaris, genome, useful for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAQ52616-28 are primers which were used in the generation of pRK 5.1 human hepatocyte growth factor (huHGF) varient molecules. The amplification products from these reactions were cloned in E. coil cells and were then used to transfect human fetal kidney 293 cells. The expressed proteins were used to study the ability of huHGF to induce DNA synthesis of hepatocytes in primary culture. The expressed proteins may be used as first and/or second ligands in a conjugate for receptor activation. These conjugates may be used to activate the respective receptors and thereby mimic the biological activity of the corresponding native ligand.
                                                                                                                                                                                                                                                                                                                                                                                                            Activation of receptors, partic. of growth factors - using conjugate of two ligands capable of binding to receptors, for mimicking biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 11.8; DB 14; Length 30;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              119,

APPLICANT: Red, Chamer
TITLE OF INVENTION: A cDNA Genomic Hybrid Sequence Encoding APP770
Patent No. 5604131
TITLE OF INVENTION: Containing a Genomic DNA Insert of the KI and OX-2 Regions
NUMBER OF SEQUENCES: 45
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20, Application US/09015876
Patent No. H001825
GENERAL INFORMATION:
APPLICANT: ROMANO, JOSEPH W
APPLICANT: RUNTLIFF, ROXANNE
APPLICANT: WILLIAMS, KIMBERLY G
TITLE OF INVENTION: ISOTHERMAL TRANSCRIPTION BASED ASSAY
TITLE OF INVENTION: FOR THE DETECTION OF HTLV I AND HTLV II
NUMBER OF SEQUENCES: 28
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 11.4; DB 1; Length 30;
